The Rise of DataOps

What is **DataOps**?

A process framework that helps data teams deliver **high quality, reliable** data insights with **high velocity**.

Inspired from DevOps and Agile Principles, and applies them to Data Analytics

The DataOps framework

Data Observability

Observability and Monitoring: the Evolution of the IT Stack

Infra & App Management

DevOps: Key is to monitor, observe, triage, diagnose, and resolve infrastructure and performance issues.

Data & Model Management

DataOps (& MLOps):
Key is to monitor, observe, triage, diagnose, and resolve (data) issues.

Data Product

Software that uses data to drive automation and business outcomes.

Silent data issue

Data problem that rendered the data product useless for an amount of time without the owner knowing.

Data teams want to get ahead of silent data issues.

Auto Monitor

Automatically track key data characteristics, and raise incidents across all your datasets.

Test & Validate

Test the data data flows into your data pipelines to ensure we keep running on good data.

Track Fitness

Align data owners with data product teams to make sure data remains fit for purpose.

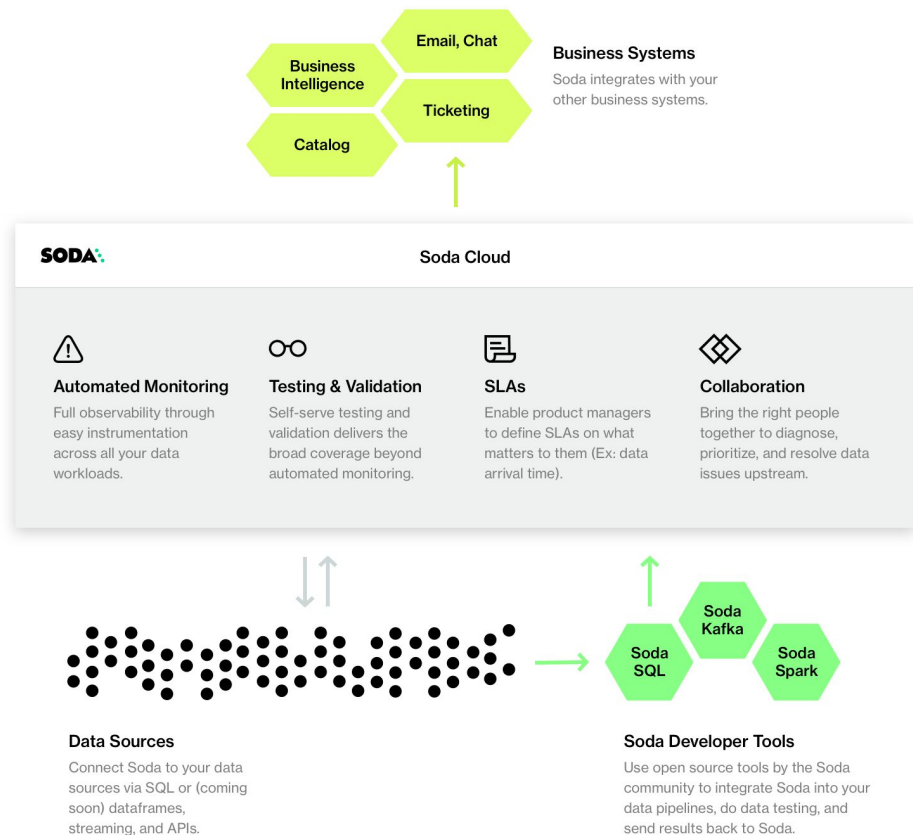

Collaborate

Break down data silos by collaboratively diagnosing, prioritizing, and resolving data issues.

Introducing Soda Cloud

Soda brings everyone closer to the data.

The Soda cloud is an integrated environment that allows you to easily connect to sources and destinations (e.g. catalogs, BI tools, ...).

Uncover data issues before your customers do.

SODA APP 10:37 AM

Issues with your data have triggered 3 critical alerts and 2 warnings.
Access your Soda Cloud account to view your data monitoring results.

Soda in Action

Summary

Soda, The Data Observability & Collaboration Platform

Soda brings everyone closer to the data.

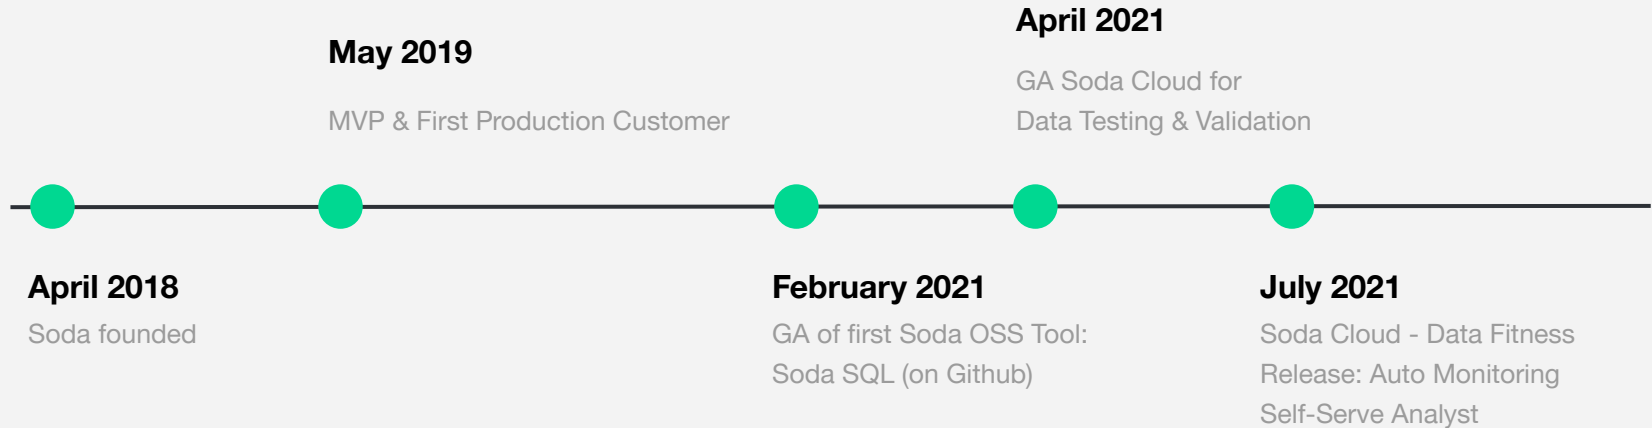

Cloud and open-source developers tools.

It works, and we can show you how!
